The Inversion: Traditional way...

Gauss-Newton smoothness constrained least squares equation (L₂ norm) with the Marquardt-Levenberg modification

$$\begin{pmatrix} \mathbf{J}_{k}^{\mathrm{T}} \mathbf{R}_{d} \mathbf{J}_{k} + \lambda_{k} \mathbf{F}_{\mathrm{R}} \end{pmatrix} \Delta \mathbf{q}_{k} = \mathbf{J}_{k}^{\mathrm{T}} \mathbf{R}_{d} \quad \mathbf{g}_{k} - \lambda_{k} \mathbf{F}_{\mathrm{R}} \quad (\mathbf{q}_{k-1} - \mathbf{q}_{0})$$

$$\mathbf{F}_{\mathrm{R}} = \alpha_{s} \mathbf{R}_{s} + \alpha_{x} \mathbf{C}_{x}^{\mathrm{T}} \mathbf{R}_{x} \mathbf{C}_{x} + \alpha_{z} \mathbf{C}_{z}^{\mathrm{T}} \mathbf{R}_{z} \mathbf{C}_{z}$$

 $\mathbf{q}_{\mathbf{0}}$ is a homogeneous reference model

Appraisal: The Depth Of Investigation (DOI)

The method carries out 2 inversions of the same data set using different values of the reference resistivity q_0 :

the two inversions reproduce the same resistivity values in areas where the data contain information about the resistivity of the subsurface

whereas ...

the final result depends on the reference resistivity in areas where the data do not constrain the model

Model Cells for Surface Surveys

ARRANGEMENT OF MODEL BLOCKS AND APPARENT RESISTIVITY DATUM POINTS

Eidgenössische Technische Hochschule Zürich

Three Examples:

Case 1: Resistivity Surveying Applied to Hydrogeological Characterisation of Quaternary Paleo-valleys

Case 2: 2D Electrical Resistivity Imaging in Mountain Permafrost Studies

Case 3: Permanent 3D Rainfall Infiltration Monitoring in Soils

Case History 1: Resistivity Surveying Applied to Hydrogeological Characterisation of Quaternary Paleo-valleys

Aim of the Study...

To image a complex Quaternary paleo-valleys framework near the city of Fribourg (Switzerland) using geoelectrical methods

These data are useful for:

... understanding the groundwater circulations and the risk of pollutant migrations for future geotechnical and hydrogeological modelling

- ... planning the creation of protected areas
- ... planning further geophysical and geotechnical surveys

The imaged paleo-valley framework. The blue color symbolizes the bottom of the valleys

Hydrogeological Implications

The paleo-valley framework is located in urban and industrial areas

Clear connexions between the main paleo-valleys and the springs

Clear connexions between the main paleo-valleys and the actual rivers

The paleo-valley infilling can be connected with the surface or protected by the moraine

The resistivity of the gravel infilling ranges from 200 to 500 ohm.m

Pollutant migration risk from the surface to the rivers is plausible

Conclusions

Resistivity methods give a general overview on the paleo-valley framework

Limitations of the method: lateral effects, loss of resolution at depth, resistivity contrast

Good correlation between the geoelectrical information and the borehole data for the bedrock altitude

Further investigations (e.g. high resolution seismics) can be conducted following the resistivity survey results

The paleo-valleys do not continue to the North

Case History 2: 2D Electrical Resistivity Imaging in Mountain Permafrost Studies

Source: Marescot et al., Near Surface Geophysics 2003

What is permafrost?

Lithological material with a temperature below 0°C during at least one whole year.

What is a rock glacier?

A mass of blocks cemented with ice. The velocity of an active rock glacier can reach a few centimetres per year.

11

= 11 Active layer (a few meters): blocks with voids

Ice or mixture of ice and soil (10 to 100 m)

- A global warming process could partially thaw permafrost.
- Potentiality and magnitude of slope instabilities are increased
- (landslides, mud flows)
- Constructions are endangered (ski resort buildings, cable cars poles, roads...)

Ways to study permafrost

- Geomorphology
- BTS (Bottom Temperature of Snow cover)
- Radiometry
- Geophysics (refraction seismics, DC resistivity, gravimetry, GPR ...)
- Drilling

Objectives of resistivity surveys

Distribution of permafrost (mapping, thickness).

Characterization of ice content in permafrost.

Monitoring.

Difficulties

Significant topographic variations.

The surface layer consists of large blocks with air voids.

ETH

Methodology

The same set without the bad data

Field Example 1: Resistive Structures

Conclusion

Effectiveness of 2D resistivity imaging is proven despite unfavourable contact resistance due to the presence of large surface blocks with voids.

Penetration depth is low under the frozen material!

This method provides information on:

The distribution (extent, +/-thickness) of ice in the rock glacier.

The ice content in soil:

unfrozen scree with voids: 30 to 200 Kohm.m

frozen-water in interstices: 10 to 500 Kohm.m

buried dead glacier ice: 100 to 2000 Kohm.m

The evolution of ice in the future (monitoring).

2

example of calculation (water content)

Conclusions

The resistivity method is a effective technique for water infiltration monitoring

Permanent instrumentation can be easily installed in the field

Need for effective 3D joint inversion technique

Calibration of water content possible using the General Geometrical Factor approach

Final Comments

Resistivity imaging is:

Cost-effective technique: permanent electrodes in the field

Adapted to monitor spatial and temporal water variations

Multi scale technique: large scale geophysics to NDT

Possible developments: Intensive research in 3D inversion for large models Appraisal part of the problem
